

Bug ID: LLH-DOC-001

Summary: Editing a Flashcard to a normalized Term already used by another Flashcard in the same Deck succeeds instead of being rejected.

Module: DOC Flashcards / Edit Flashcard

Environment:

- Local DOC API environment
- URL: `{{baseUrl}}/flashcards/{{docPatchFlashcardId}}`
- Browser/Device: Postman Desktop on Windows
- OS: Windows
- Date: 2026-09-12

Precondition:

- Learner A is authenticated.
- `docPatchFlashcardId` identifies a dedicated Learner A Flashcard.
- A different Flashcard in the same Deck supplies `normalizedDuplicateTerm`.
- The exact target Flashcard baseline is captured before the update.

Steps to Reproduce:

1. Configure native Bearer authentication with `{{learnerAAccessToken}}`.
2. Select a target Flashcard identified by `{{docPatchFlashcardId}}` and a different Flashcard in the same Deck whose normalized Term is `{{normalizedDuplicateTerm}}`.
3. Send PATCH `{{baseUrl}}/flashcards/{{docPatchFlashcardId}}` with body `{"term":"{{normalizedDuplicateTerm}}"`.
4. Reload or list the target Deck and compare the target Flashcard with its captured baseline.

Test Data:

- Test case: TC-API-DOC-012-04 — Reject duplicate term edit.
- Concrete Flashcard IDs and Term values were not retained in the submitted execution evidence; the run establishes that the source and target were different Flashcards in the same Deck.

Actual Result:

The API returned 200 OK and accepted the PATCH request, although the submitted Term

was the normalized Term of a different Flashcard in the same Deck. The case was marked Failed.

Expected Result:

The API must return 409 Conflict with JSON error code DUPLICATE_RESOURCE, a non-empty requestId, and leave the target Flashcard unchanged.

Severity: High
